- Maintainability: Sprints every month after app is launched, feature for customer feedback, several synced servers with varied locations, feature so customer can customize.

- Accessibility: Image tags, voiceover, live captions on videos.

Architectural Diagram

Explanation

- **Availability:** With a fast push and pull from the database, and by implementing them right, the app will be able to respond to user's requests.

- **Reliability:** By using JavaScript, a proper database (3NF), and applying the coding styles, we make sure that the right results are shown to the user at each request.

- **Maintainability:** By keeping an eye on customers' feedback and having multiple servers all over the country, and the most important one, with the paid subscription, we can make sure that the web app is well maintained at all times.

- **Accessibility:** All of the videos are featured with an accurate live caption, as well as voice over for the texts and alternate texts for pictures so our disabled users can also use the full potential of the web app.
